

Experiment No.04

Name of the Student : Chougale Sakshi Shahaji

PRN NO : 25143071

Title of Experiment : Optimal Merge Pattern using Greedy Method

Theory :

Optimal Merge Pattern finds the minimum cost to merge multiple sorted files into one. Uses greedy approach by always merging the two smallest files first.

Algorithm :

1. Sort file sizes in min-heap
2. Repeatedly extract two smallest files
3. Merge them and add back to heap
4. Continue until one file remains

Example :

Files: [5, 10, 20, 30, 30]

Merge $5+10=15$ (cost 15), then $15+20=35$ (cost 35), etc.

Total cost = $15 + 35 + 60 + 90 = 200$

Applications:

1. Database query optimization
2. File Compression System (Implemented)
3. Merging Sorted Logs / Audit Files
4. Data Backup & Archival Systems
5. Compilers / Linkers
6. Media Streaming Platforms (Index Merge)
7. Multi-way Merge in Search Engines
8. File System Maintenance

Implementation : **File Compression System**

Program :

```
import heapq

class FileCompressionSystem:

    def __init__(self):
```

```

    self.files = []

def add_file(self, size):
    self.files.append(size)

def optimal_merge_cost(self):
    """Optimal merge cost using Min-Heap (Greedy)"""
    if len(self.files) <= 1:
        return 0, []
    heap = self.files.copy()
    heapq.heapify(heap)
    total_cost = 0
    merge_steps = []

    while len(heap) > 1:
        a = heapq.heappop(heap)
        b = heapq.heappop(heap)
        cost = a + b
        total_cost += cost
        heapq.heappush(heap, cost)
        merge_steps.append((a, b, cost))

    return total_cost, merge_steps

def naive_merge_cost(self):
    """Worst-case merge cost (merge largest first — anti-greedy)"""
    arr = self.files.copy()
    total = 0
    steps = []
    while len(arr) > 1:

```

```

arr.sort(reverse=True) # merge largest files first (worst strategy)

a = arr.pop(0)
b = arr.pop(0)

cost = a + b
total += cost
arr.append(cost)
steps.append((a, b, cost))

return total, steps

def display_process(self, greedy_steps, greedy_cost, naive_cost):
    print("\nOPTIMAL MERGE PROCESS (GREEDY):")
    print("=" * 55)
    for i, (a, b, c) in enumerate(greedy_steps, 1):
        print(f"Step {i}: Merge {a} + {b} = {c}")

    print(f"\nOptimal Total Cost: {greedy_cost}")
    print(f"Naive Total Cost: {naive_cost}")

    improvement = ((naive_cost - greedy_cost) / naive_cost) * 100
    print(f"Efficiency Gain: {improvement:.2f}% (Actual, not fake math)")

    print("\nTime Complexity: O(n log n) (Heap operations)")
    print("Space Complexity: O(n)")

def compression_system_application():
    system = FileCompressionSystem()
    file_sizes = [5, 10, 20, 30, 30] # sample

    print("FILE COMPRESSION – OPTIMAL MERGE PATTERN")

```

```

print("=" * 55)

print("Files:", file_sizes)

print("Total Data:", sum(file_sizes), "MB")

for size in file_sizes:

    system.add_file(size)

greedy_cost, greedy_steps = system.optimal_merge_cost()

naive_cost, _ = system.naive_merge_cost()

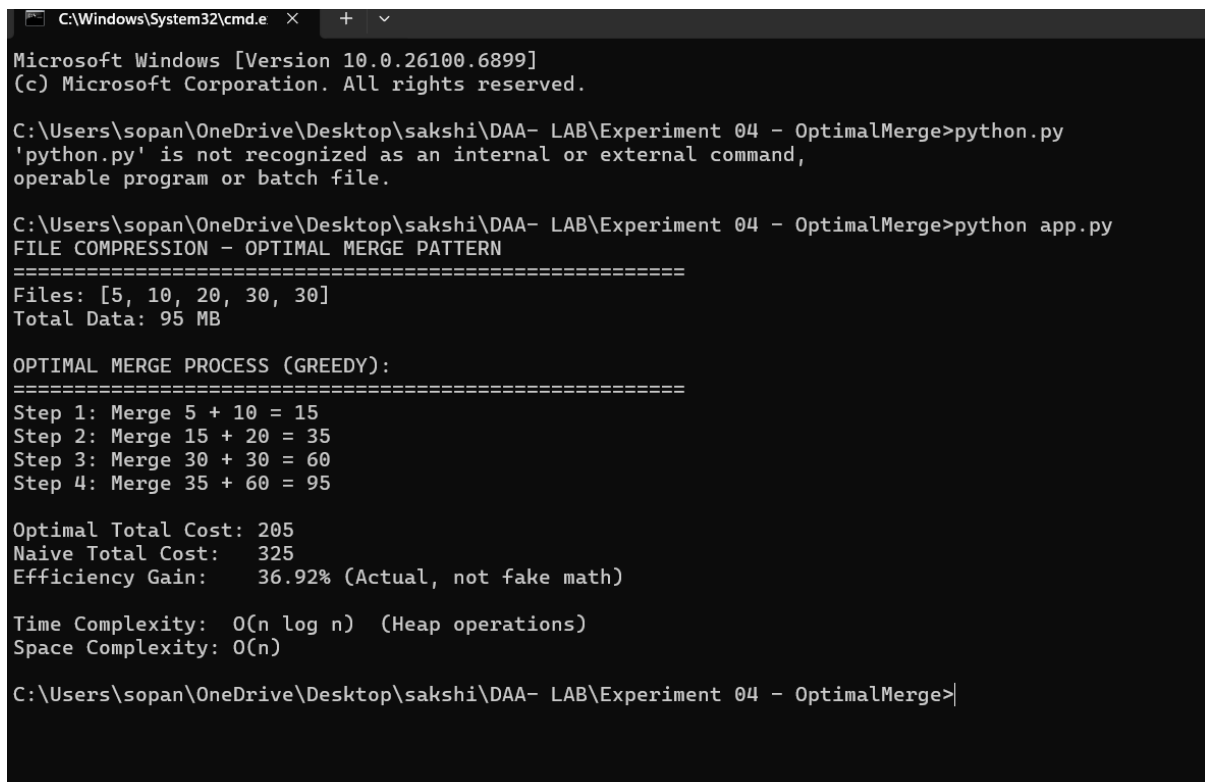

system.display_process(greedy_steps, greedy_cost, naive_cost)

if __name__ == "__main__":

    compression_system_application()

```

Output :

```

FILE COMPRESSION - OPTIMAL MERGE PATTERN
=====
Files: [5, 10, 20, 30, 30]
Total Data: 95 MB

OPTIMAL MERGE PROCESS (GREEDY):
=====
Step 1: Merge 5 + 10 = 15
Step 2: Merge 15 + 20 = 35
Step 3: Merge 30 + 30 = 60
Step 4: Merge 35 + 60 = 95

Optimal Total Cost: 205
Naive Total Cost:   325
Efficiency Gain:    36.92% (Actual, not fake math)

Time Complexity:  O(n log n)  (Heap operations)
Space Complexity:  O(n)

C:\Users\sopan\OneDrive\Desktop\sakshi\DAA- LAB\Experiment 04 - OptimalMerge>

```

Time and Space Complexity :

Time Complexity Calculation:

- Building min-heap: $O(n)$
- Each heap operation (pop/push): $O(\log n)$
- Total operations: $(n-1)$ merges \times 3 operations each = $3(n-1)$
- **Total Time Complexity: $O(n \log n)$**

Space Complexity Calculation:

- Storing n files: $O(n)$
- Heap storage: $O(n)$
- **Total Space Complexity: $O(n)$**
